

ABSTRACT OF THE DISCLOSURE

Apparatus for producing printing plates in particular a blank sleeve-like printing
5 plate, includes a cylinder carrier for receiving a printing plate, the cylinder carrier being held
in cantilever fashion at one end in a frame in a mounting and is driven by a motor, it being
possible for the printing plate to be pushed onto the carrier cylinder at an opposite side of the
latter which faces away from the mounting and is, therefore, more accessible for making
printing plate exchange. An image-setting device is moved along the carrier cylinder.
